SWITCHING SOLUTIONS

PRECISION ELECTROMECHANICAL RF & MICROWAVE SWITCHES

Experience

The CEI engineering team offers more than (40) years of experience designing and manufacturing electromechanical switches. We understand every aspect of the RF Switch and the many special techniques used in the manufacturing process. We are committed to providing products that are distinguished by quality and reliability.

Our team seeks out the latest technology methods and quality assurance tools to provide the most cost effective solutions to our customers increasingly higher performance needs.

Our commitment of resources and dedication to our customers is the foundation of our first-class reputation in the RF and Microwave industry.

Quality

A CEI electromechanical switch is designed to give you absolute, unqualified measurement certainty. At CEI, quality is the top priority. It begins by partnering with vendors who supply us with quality material and reliable shipment dates, and continues with a rigorous quality control inspection that conforms to ISO 9001 and AS9100 . Official certification wil soon follow. All products are meticulously tested on state of the art testing equipment. Every detail, from vendor qualification to final inspection is scrutinized to ensure that you receive a superior product-on time, every time.

Support

The process begins with an inquiry through our website, email, telephone call, representative, or distributor.

A quotation will typically be provided within one business day or sooner.

The delivery will be based on your need and on-time, everytime.

Our commitment to customer satisfaction and customer driven lead-time requirements ensures that we do everything possible to provide the highest quality RF switches when you need them.

Commitment

Charter Engineering is a dB Control Corp. and Heico company.

We maintain the values of a small business with the resources of a large corporation.

Charter Engineering Inc. manufactures all products in the USA.

Switch to Charter and Switch for life!

CHARTER ENGINEERING, INC.

DEFINITIONS AND TERMINOLOGY

Electromechanical Switch Models

BREAK-BEFORE-MAKE - DISCONNECTING THE RF POWER from the current RF circuit position before selecting a different position. All CHARTER ENGINEERING switches are break-before-make designs.

SPDT Switch - A single-pole, double-throw switch has one input or output port and two selectable input or output ports.

SPDT Terminated Switch - A single-pole, double-throw switch with one open output or input RF port internally terminated in a 50-ohm resistive load.

Multi-position Switch - A switch with one input or output and more than two output or input ports. Standard CEI multi-throw switches provide up to 6 selectable outputs or inputs from a single input or output port.

Multi-position Terminated Switch - A multi-position switch with each unused or open input or output RF port internally terminated in a 50-Ohm resistive load.

Actuator Terminology

Failsafe - A mode of operation in which the switch moves to the closed position when the actuating voltage is applied and always returns to a predetermined position when the voltage is removed.

Latching - A mode of operation in which the switch moves to the closed position when the actuating voltage is applied and will remain in the selected position regardless of whether the actuating voltage is removed or interrupted. In order to change to another position the voltage must then be reapplied to the position desired. The latching models can also operate by **pulse voltage** at a 30 millisecond pulse minimum. The pulse voltage technique can save power and will allow the system to run at cooler temperatures.

Momentary (normally open) - A mode of operation in which all output ports of the switch are disconnected from the input port until a voltage is applied to maintain a selected position. The switch returns to its open position with the removal of voltage.

Common Input Command Voltage: A mode of operation in which the supply voltage and control voltage can be positive or the return voltage be negative (this catalog designates the “+” or positive and the “-” or negative signs). To select a position using positive voltage the common voltage must be the return voltage. To select a position using return voltage the positive must be supplied at the common terminal.

Electromechanical Switch Options

INDICATOR CIRCUITRY: A set of internally mounted contacts mechanically connected to the switch actuator allowing external monitoring of switch RF status.

SUPPRESSION DIODES: This option offers fast-recovery rectifiers (diodes) connected in parallel with the coils of the switch to suppress any transient voltage generated by the coils. Suppression Diodes are recommended with TTL Logic.

TTL LOGIC: Transistor-transistor-logic driver circuitry which enables the status of the switch to be controlled by the level of the TTL logic input.

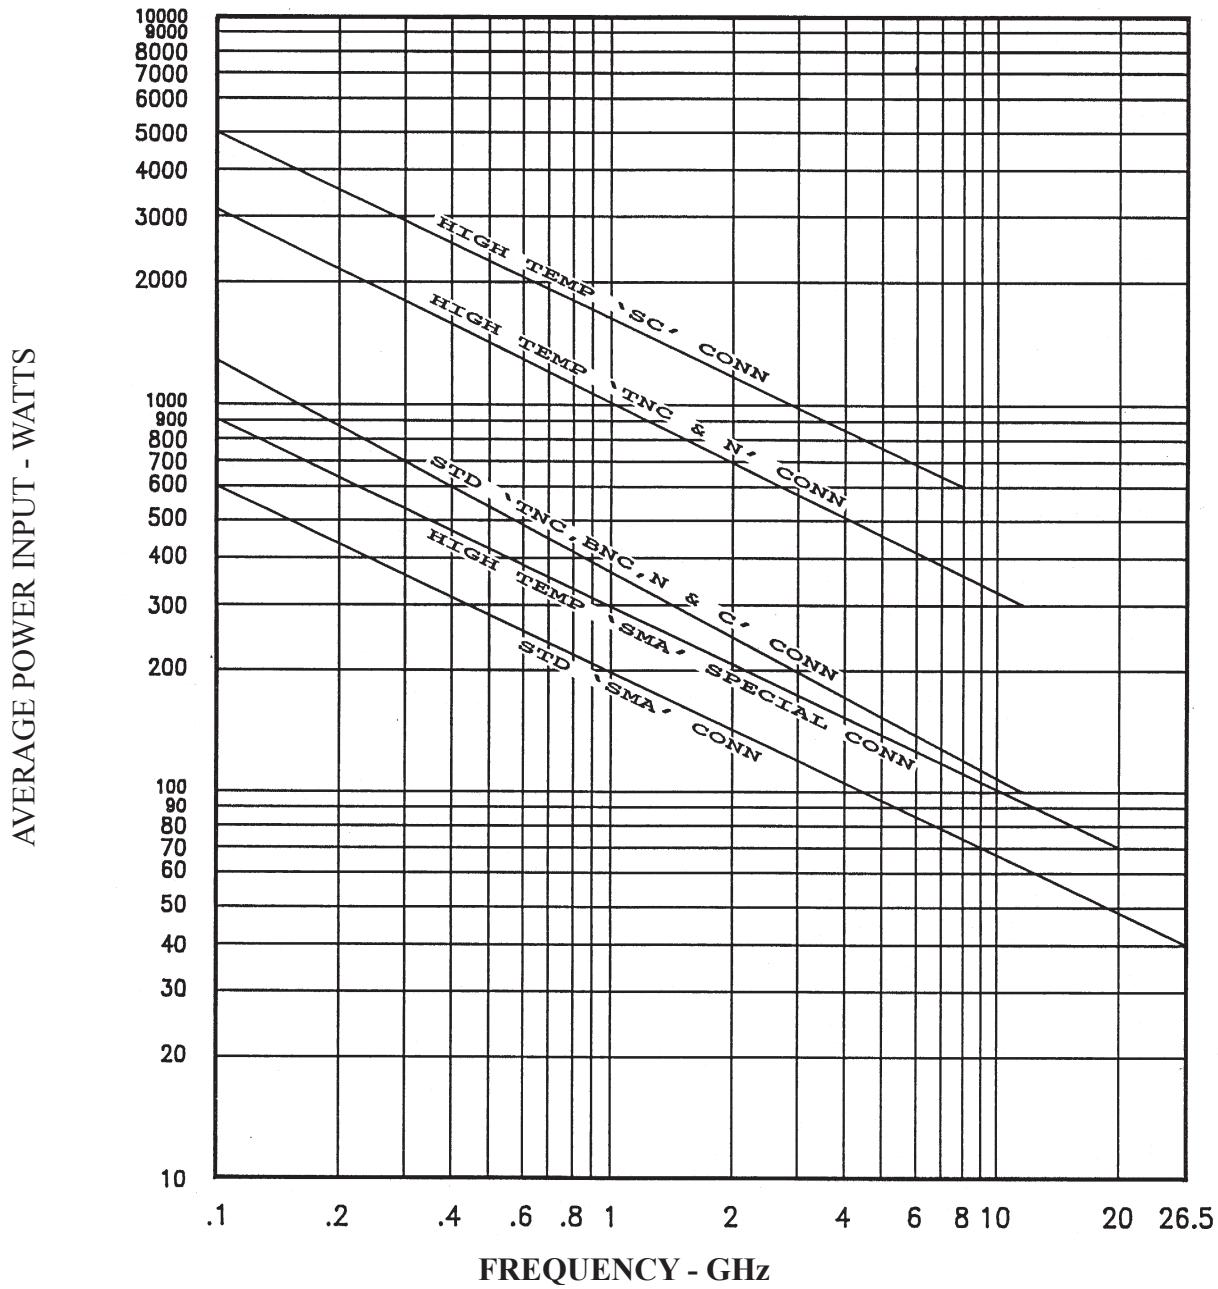

BCD TTL DECODER: Completely contained within the switch housing, BDC logic circuitry establishes compatibility of the switch with binary logic inputs.

CUT OFF POWER CIRCUIT: This applies to a latching type switch only. A switch that has the ability to disconnect the actuator drive circuit so that D.C. current will not be consumed after switching has been accomplished.

LOW, ULTRA LOW, OR SUPERIOR PASSIVE INTERMODULATION (PIM): This option allows for a -110 dBc (LOW), 130 dBc (ULTRA LOW) or -160 dBc (SUPERIOR) passive intermodulation (PIM) level @ the PIM frequency. PIM is a form of signal distortion that occurs whenever signals at two or more frequencies conduct simultaneously in a passive device which contains some non-linear response.

POWER HANDLING VS. FREQUENCY CHART

CAPABILITY OF POWER HANDLING IS BASED ON THE FOLLOWING CONDITIONS:

AMBIENT TEMPERATURE	=	25° C
ALTITUDE	=	SEA LEVEL
LOAD VSWR	=	1:1 RATIO

POWER HANDLING AND DERATING FACTORS

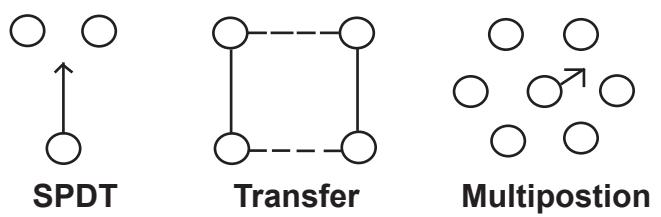

<u>Temp (Deg. C)</u>	<u>Factor</u>
25-40	1.00
60	0.89
80	0.79
100	0.69
120	0.59
140	0.49
160	0.39
180	0.29
200	0.20
<u>Altitude (Ft.)</u>	<u>Factor</u>
10,000	0.91
15,000	0.86
20,000	0.81
25,000	0.76
30,000	0.71
35,000	0.67
40,000	0.62
45,000	0.58
50,000	0.53
60,000	0.44
65,000	0.40
70,000	0.36
<u>VSWR</u>	<u>Factor</u>
1.5 : 1	0.96
2.0 : 1	0.88
2.5 : 1	0.84
3.0 : 1	0.75
3.5 : 1	0.70
4.0 : 1	0.64
4.5 : 1	0.60
5.0 : 1	0.56

HOW TO SELECT A COAXIAL SWITCH

Consider the following parameters to select the most suitable switch for a specific application.

1. **RF Circuit** - The three most common circuit configurations are (1) single-pole-double-throw (SPDT), (2) Transfer (DPDT), and (3) Multi-Position. Select the simplest circuit to meet system requirements.

2. **Actuator** - The **Pulse Latching Actuator** is recommended. Actuation requires a pulse length equal to or greater than the switching time. This type of switch requires current only during switching and for a very short period of time. A pulse width of 30 milliseconds minimum will more than satisfy current requirements. There is also no need to supply DC power to hold the selected position. However, pulse latching can be operated with continuous DC power supplied to the unit with no degradation or decrease in life expectancy.

A latching switch with internally **cut off current circuitry** can be obtained from CEI in some models if your system is not equipped with pulse command circuitry. This option will disconnect the drive circuit so that DC current will not be consumed after switching has been accomplished.

The Fail-Safe Actuator is used where system requirements dictate the switch return to the normally closed or fail-safe position when actuator power is removed. Most Charter Engineering fail-safe switches utilize magnetics rather than springs for fail-safe holding power.

The Momentary or Normally Open Actuator is used where system requirements require all output ports of the switch to be disconnected from the input port until a voltage is applied to a selected position.

3. **Frequency** - Specify the actual frequency to be used as minimum bandwidth. This often results in reduced testing time and associated costs.

Generally, electromechanical switches are capable of higher-frequencies and greater bandwidths than necessary for the intended usage.

The following table correlates frequency and connector type:

Frequency	Connector	Note
18.0 GHz	SMA	Standard
26.5 GHz	SMA	Standard
40.0 GHz	2.92 mm	Standard
12.4 GHz	N	Standard
14.0 GHz	N	Special Order
6.0 GHz	SC	Standard

RF Connectors - Type SMA is the recommended connector except for high power requirements. The normal frequency limit is 18.0 GHz however, Charter Engineering can supply switches which function up to 26.5 GHz. CEI can also supply a special SMA connector enabling higher power capability.

The Type N connector is recommended for optimum RF performance and operation at power levels greater than the SMA power rating. See CW Power Capability vs. Frequency Chart on page 4-5. CEI can also supply a special Type N connector enabling higher power capability.

The 2.92 mm connector is recommended for higher frequency and 5G applications.

The Type SC connector is recommended for high power applications in which large diameter cables are used for extremely low loss. SC is normally used up to 1000 MHz, but Charter Engineering has modified the design to operate up to 6.0 GHz.

CEI can also custom design switches using your required connector. Contact CEI for further details.

HOW TO SELECT A COAXIAL SWITCH

4. Actuator Voltage - All standard Charter Engineering switches offer the voltages below. Other voltages can be supplied depending on the switch model. The following list consists of available voltage options for most CEI switches:

SMA Connectors, 2.92 mm

Switch Series	Voltage (Vdc)
SPDT	28.0, 24.0, 15.0, 12.0
SPDT Terminated	28.0, 24.0, 15.0, 12.0
SP3T-SP6T	28.0, 24.0, 15.0, 12.0
SP3T-SP6T Terminated	28.0, 24.0, 15.0, 12.0
SP7T-SP8T	28.0, 24.0, 15.0, 12.0
SP7T-SP8T Terminated	28.0, 24.0, 15.0, 12.0
SP9T-SP12T	28.0, 24.0, 15.0, 12.0
SP9T-SP12T Terminated	28.0, 24.0, 15.0, 12.0
DPDT (Transfer)	28.0, 12.0, 15.0, 24.0

Type N Connectors, Type SC

Switch Series	Voltage (Vdc)
SPDT	28.0, 24.0, 15.0, 12.0
SPDT Terminated	28.0, 24.0, 15.0, 12.0
SP3T-SP6T	28.0, 24.0, 15.0, 12.0
DPDT (Transfer)	28.0, 24.0, 15.0, 12.0

5. Polarity - Each CEI switch offers the option of either a positive (+) or negative (-) common. The exception is the SPDT Failsafe series which does not require a common.

6. Power Interface - All CEI switches are provided with solder terminals. The MS connector (MIL-STANDARD) and D'SUB Miniature Series can be supplied instead of terminals on most switch series.

Many catalog pictures feature D'SUB connectors and MS Connectors which are readily available alternatives to solder terminals.

Charter Engineering can also supply other sources of power interface. Please contact CEI with your custom requirement.

7. Options -

CUT OFF POWER CIRCUIT- This applies to latching switches only. A switch that has the ability to disconnect the actuator drive circuit so that D.C. current will not be consumed after switching has been accomplished.

TTL LOGIC - Transistor-transistor-logic driver circuitry enables the status of the switch to be controlled by the level of the TTL Logic input. Users can apply the power voltage across a pair of designated power terminals and then control switch operation with a 5 volt control circuitry.

CEI'S TTL Logic has a remarkable circuitry which will allow the actuator to draw current only when the TTL is at a high state (5.0 Vdc) and to draw a current of only 5.0 mA max at a low state (0 Vdc). This amazing circuitry will enable your system to run cooler and will save a substantial power supply to the switches.

INDICATOR CIRCUITRY - CEI can supply a set of internally mounted contacts mechanically connected to the switch actuator allowing external monitoring of switch RF status.

SUPPRESSION DIODES - CEI can supply fast-recovery rectifiers (diodes) connected in parallel with the coils of the switch to suppress any transient voltage generated by the coils. Suppression Diodes are recommended with TTL Logic.

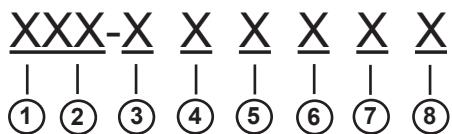

8. Intermodulation - Passive Intermodulation (PIM) is a form of signal distortion that occurs whenever signals at two or more frequencies conduct simultaneously in a passive device (electromechanical switch) which contains some non-linear response. This interference phenomenon is attributable to many sources such as dissimilar metals, dirty interconnects, or other anodic effects. PIM is of particular concern whenever:

9. Special Options - CEI can provide switches with enhanced temperature and power handling capabilities.

For further details, please contact CEI.

ORDERING INFORMATION

How to Order:

To place an order please contact Charter Engineering, Inc. (CEI) at:

Charter Engineering, Inc.
6729 55th Street North
Pinellas Park, FL 33781
Tel: (727) 525-1025
Fax: (727) 525-1050
Website: www.ceiswitches.com
Email: sales@ceiswitches.com

CAGE CODE: 1SWE8

Domestic Terms:

Domestic Terms are Net 30 days, F.O.B CEI factory upon credit approval unless otherwise specified.

Customers without credit approval are shipped C.O.D. unless payment has been received in advance.

Charter Engineering, Inc. also accepts VISA, Mastercard, Discover, and AMEX.

International Terms:

International Terms require full payment in advance of shipment or against irrevocable letter of credit.

If payment is made via wire transfer, the customer is required to pay the wire transfer fee for both the sending and receiving banks. Freight charges, customs duty, custom clearance costs and applicable taxes are to be paid by the customer.

Shipping:

Domestic shipments are usually made via UPS Ground service unless otherwise specified. International shipments are made using a variety of carriers. Charter Engineering, Inc. will choose the most appropriate means of transportation unless specified by the customer. The customer has the option to bill their own account number or prepay and add the charges.

Certificate of Compliance:

Charter Engineering Inc. (CEI) will include a Certificate of Compliance with each purchase order.

Warranty:

Charter Engineering, Inc. (CEI) warranties each new product to be free from defects in material and workmanship from one (1) year of the date of shipment.

Any component found to be defective under normal use for a one year period will be either repaired or replaced without charge. Damage by the customer due to excessive power handling, hot switching, or similar may not be repairable and require purchase of a new unit. CEI shall not be liable for installation and consequential damages. Before returning any product, please contact CEI for a Return Material Authorization (RMA). When requesting an RMA, you will need to provide the model number, serial number, and as much information as possible about the nature of the difficulty or reason for return. For products not covered by the warranty, a quotation for repair charges will be provided for customer approval. CEI shall not be responsible for shipping payment to our facility. If the returned products are determined to be the fault of CEI manufacturing we shall ship the repaired/replaced units via ground service on our account. Please note any faster service other than ground must be paid by the customer.

Change Orders and Cancellations:

All orders are build to order based on thousands of model variations. A purchase order may not be cancelled without the express written consent of CEI. Any change order, cancellation, or return will be subject to a restocking fee determined by CEI at up to 100% of the original cost. Change Orders regarding price, delivery, or any conditions not specified on the original order, will be considered in effect after mutual agreement has been affirmed in writing between the customer and CEI. All cancellations, changes, and returns will be dependent upon customer's agreement to satisfy all charges incurred by Charter Engineering, Inc. and may not be cancellable.

Product and Price Changes:

Charter Engineering, Inc. reserves the right to alter price and specifications of all products without notice.
