

Videosign

Changes to Existing Features

Signature Alignment Within Tag – Placed signatures will now always be aligned to the bottom left of a tag (previously centred)

Descenders - When a typed signature includes a descender letter, the descender will no longer be taken into account when positioning the signature within the tag. Instead, descenders will drop below the base of the tag to allow the signature to rest on the 'sign here' line.

Reuse Initials - Similarly to signature reuse, participants are now able to reuse their created initials. This saves time when a document must be initialled multiple times.

Signature Font – The signature font has been replaced with one which provides better legibility and closer resembles handwriting.

Signature Line Weighting – The weighting of the line drawn within a drawn signature is now heavier, producing an easier to read, bolder signature.

New and Enhanced Features

Colour Tagging – Each participant will now be allocated a unique colour. The colour will show on their video feed, on their personalised tags, and within the host view document toolbar. This will help users to identify which tags belong to them, and allow for an all-round better UX.

Free-Sign Signature Reuse – Participants can now reuse 'Free Sign' signatures (in addition to reusing tagged signatures)

Document Integrity Check – Documents will now be checked during the upload process to ensure that they are not corrupt. Corrupt documents will be rejected.

Warning Message for Page Size Variations – When a document is uploaded which includes multiple page sizes (as opposed to one uniform page size throughout the document), the participant will be warned when trying to open the document that the document performance may be affected.

New File Picker – Documents can now be visualised and selected in either list view, or tile view from a new file picker enhancement.

Resolved Issues

Signature Offset following save – In certain situations it was found that signatures appeared slightly offset after the document was saved. There have since been a number of stability and performance improvements made around signature placement for all signature types and signature offsetting has now been resolved.

Video Recording showing upon meeting entry – Bug fixed which resulted in the recording button showing as already recording when a participant entered a meeting before a host.

Coming Soon

Dark Mode – A new, configurable, easier on the eyes colour scheme allowing the user to remove the bright white background of the UI in favour of a darker background.

Video Layout – A new video layout when the document is not rendered, enabling video to utilise the full screen real estate, and offering a better meeting experience.

Screen Share Screen Size – Increasing the size of the default screen share window to enable users to see a maximum amount of the shared screen.

Add Image – User will be able to add images to the document by uploading them from their computer and dropping them onto the document itself via a new 'Add Image' menu option.
